

AI Workflow Audit & Tool Setup

FL-01 · AI Fluency Track · [Your Name] · August 2026

Task classification

Ten or more recurring tasks from a real week (YouTube channel, the Video Editing Platform project, and the FlyRank ML internship), classified using the just-me / delegate / collaborate / automate framework from Mollick's "On-boarding your AI Intern."

#	Task	Bucket	Rationale
1	Configuring a Claude Project for generating YouTube scripts	Just me	I know exactly what tone/instructions the channel needs — no ambiguity for AI to resolve.
2	Writing a script for a YouTube video	Just me	My voice and delivery are the actual product; an AI draft would flatten what makes the channel mine.
3	Configuring a Claude Project for the Video Editing Platform	Just me	Same as above — I already know what I want the project to do before writing the instructions.
4	Creating a System Architecture Diagram (Video Editing Platform)	Delegate, review	AI gives a fast structural first pass; I verify it matches the real system before trusting it.
5	Creating a Use Case Diagram (Video Editing Platform)	Delegate, review	Same reasoning as the architecture diagram — fast draft, I check it against real requirements.
6	Creating a Component Diagram (Video Editing Platform)	Delegate, review	Same — structural correctness is checkable; I don't need to draw it by hand to verify it.
7	Creating a Sequence Diagram (Video Editing Platform)	Delegate, review	Same — the flow logic is easy for me to review even though drawing it from scratch is slow.
8	Reading a new weekly FlyRank task card and scoping what's needed	Delegate, review	AI can interpret the card and propose a plan fast; I review the plan before anything gets built.
9	Debugging a failing DuckDB/pandas pipeline step	Collaborate	Needs real back-and-forth — I don't know the fix going in, and neither does the AI without iterating.
10	Verifying a notebook's real outputs before committing	Just me	This is the actual quality gate — trusting AI's word that it ran is how leakage bugs get missed.
11	Committing and pushing a finished notebook to GitHub	Just me	My own git workflow and credentials — low value for AI to touch, and it's mine to own.

5 tasks just me · 5 delegate-with-review · 1 collaborate · 0 fully automated — no task is trusted end-to-end without a human checkpoint yet, which is an honest starting point, not a gap.

Three target tasks for FL-02 – FL-04

Chosen to span three different buckets, so the point of reusing them across the next few weeks is watching how the collaboration itself changes — not just repeating the same kind of task.

1. Video Editing Platform diagrams — Delegate, with review

Done well: the diagram matches the platform's actual planned structure with zero factual errors after one review pass, and needs no more than minor visual cleanup.

2. Debugging a failing FlyRank pipeline step — Collaborate

Done well: I can explain why it broke afterward — not just that Claude produced a fix that happened to run.

3. YouTube script writing — Just me (deliberate baseline)

Done well: if AI assistance is ever tested here, a regular viewer can't tell the difference, and it doesn't cost more editing time than writing it solo would have.

Framework: Ethan Mollick, "On-boarding your AI Intern." Tool setup (Claude, ChatGPT, Anthropic Academy accounts; AI Fluency: Framework & Foundations, Module 1) and the configured Claude Project screenshot are submitted alongside this table.
