

Professional Video Editing Platform (Ubuntu-focused)

BASELINE: Version 0 (Weak Prompt)

The Prompt

| "Help me write copy for a video editing platform landing page."

The Output (Excerpt)

"Welcome to our revolutionary video editing platform! We are passionate about delivering cutting-edge solutions for content creators worldwide. Our state-of-the-art technology empowers you to unleash your creativity and produce professional-grade videos effortlessly. Whether you're a beginner or a seasoned professional, our platform offers intuitive tools and powerful features to bring your vision to life. Join thousands of satisfied users and experience the future of video editing today. Sign up now and start creating!"

Four Notes

Note	Response
What changed in the prompt	N/A — This is the baseline.
What improved in the output	N/A — Baseline is intentionally weak.
What still failed	Everything. Generic, buzzword-heavy, no substance, sounds like every SaaS landing page ever.
What I would try next	Add a clear goal. What do I actually want this page to do?

VERSION 1: Add a Clear Goal

The Change (Layer)

Clearer Goal: I want the landing page to convince Ubuntu users that they can edit video without switching to Windows.

The Prompt

"Write copy for a landing page that convinces Ubuntu users they can edit video on their current machine without dual-booting Windows. The page should make them feel like they've found a solution to a frustrating problem."

The Output (Excerpt)

"Tired of rebooting into Windows just to edit video? You're not alone. This landing page is for Ubuntu users who want professional video editing without the hassle. Our platform runs in your browser—no installation, no NVIDIA GPU required, no rebooting. Just open Chrome and start editing. We built this because we were tired of dual-booting too. Keep reading to see how it works."

Four Notes

Note	Response
What changed in the prompt	Added a clear, specific goal: target Ubuntu users, solve the dual-boot problem.
What improved in the output	The output actually speaks to a real person with a real problem. No more "revolutionary" and "cutting-edge" garbage. It starts with empathy.
What still failed	Still too general. No mention of how it works, no details, no credibility. Still feels like a generic landing page with a slightly better hook.

Note	Response
What I would try next	Define the audience more specifically. Which Ubuntu users? What type of video editing do they do?

VERSION 2: Define the Audience

The Change (Layer)

Defined Audience: Freelance video editors who use Ubuntu and need basic editing (cuts, trimming, export) without complex effects.

The Prompt

"Write landing page copy for a video editing platform. Target audience: freelance video editors who use Ubuntu and need to do basic editing (cuts, trimming, MP4 export) without complex effects or color grading. They're frustrated with dual-booting and want a browser-based solution. Convince them this is the tool they've been waiting for."

The Output (Excerpt)

"You're a freelance video editor. You use Ubuntu because you love the open-source ecosystem. But every time a client sends a rush job, you face the same choice: reboot into Windows and waste 20 minutes, or struggle with Linux tools that crash on export.

*

We built this for you. A browser-based video editor that handles the essentials—cuts, trimming, timeline editing, and MP4 export. No effects. No color grading. Just clean, fast editing that works on your Intel-powered Ubuntu machine.

*

Because you shouldn't need an NVIDIA GPU to pay your bills."

Four Notes

Note	Response
------	----------

What changed in the prompt	Defined the audience specifically: freelance video editors using Ubuntu, basic editing needs.
-----------------------------------	---

What improved in the output	The copy now addresses a specific person—the freelance editor. It mentions their tools (Ubuntu), their pain (rebooting), and their type of work (basic editing). The line "you shouldn't need an NVIDIA GPU to pay your bills" lands well.
------------------------------------	--

What still failed	Still no credibility. Why should they trust me? No mention of the product's real features or proof it actually works. It's all pain, no solution detail.
--------------------------	--

What I would try next	Add real context: what is the product, what does it actually do, what are the specifics?
------------------------------	--

VERSION 3: Add Real Context

The Change (Layer)

Real Context: Describe the product's actual features: WebAssembly, IndexedDB, timeline editing, no upload required.

The Prompt

"Write landing page copy for a browser-based video editing platform built for freelance video editors using Ubuntu. The platform uses WebAssembly for performance, stores all footage locally in IndexedDB (nothing uploaded to a server), and provides timeline editing with basic cuts and MP4 export. No effects or color grading. It runs on any browser with no installation. Convince the reader that this tool is reliable, fast, and solves their dual-boot frustration."

The Output (Excerpt)

"You've got 20 minutes before a client calls. You open DaVinci Resolve on Ubuntu—and it crashes. Or worse, it tells you it needs NVIDIA. You're stuck.

*

This is where we come in. A browser-based video editor that uses WebAssembly for near-native performance and stores everything locally in IndexedDB—so your footage never touches a server. Timeline editing, cuts, trimming, and MP4 export. No effects. No color grading. Just the essentials, done reliably.

*

No installation. No NVIDIA. No rebooting. Just open Chrome and edit."

Four Notes

Note	Response
What changed in the prompt	Added concrete details about the product: WebAssembly, IndexedDB, timeline editing, local storage.
What improved in the output	Now the copy actually describes what the product does. It has technical credibility—WebAssembly and IndexedDB signal competence to a technical audience.
What still failed	Still lacks social proof or any way for the reader to verify that it actually works. No demo, no screenshots, no user quote. It's a list of features but no evidence.
What I would try next	Add constraints: what is the scope? What does it NOT do? Honest positioning builds trust.

VERSION 4: Add Constraints (Honest Scope)

The Change (Layer)

Constraints: Be honest about what the tool doesn't do. No effects, no color grading, no multi-track audio. Focus on the "good enough" value.

The Prompt

"Write landing page copy for a browser-based video editing platform for freelance Ubuntu editors. Uses WebAssembly and IndexedDB. Features: timeline editing, cuts, trimming, MP4 export. Does NOT support: effects, color grading, multi-track audio, or 4K. Be honest about these limitations. Position the tool as 'good enough for quick edits' rather than 'the best editor ever.' Target freelance editors who need speed and simplicity, not Hollywood features."

The Output (Excerpt)

"Let's be honest. This isn't DaVinci Resolve. It doesn't do effects, color grading, or multi-track audio. It won't handle 4K footage.

*

What it does do: timeline editing, cuts, trimming, and MP4 export. Fast. Reliable. In your browser. On Ubuntu.

*

If you're a freelance editor who needs to turn around a client cut in 15 minutes without rebooting into Windows, this is for you. If you need Hollywood features, keep scrolling—this isn't that.

*

But if you're tired of dual-booting just to trim a clip, we built this for you. WebAssembly performance. Local storage. No uploads. No NVIDIA. Just the essentials, done well."

Four Notes

Note	Response
What changed in the prompt	Added constraints and honest limitations. Positioned as "good enough" not "the best."
What improved in the output	The honesty is refreshing. It builds trust. By saying what it doesn't do, the reader believes what it does do.
What still failed	Still no concrete example of what "good enough" looks like. What does a successful edit look like? Show, don't just tell.

Note	Response
What I would try next	Add an example of what "good" looks like—a sample edit scenario or a mini-demo walkthrough.

VERSION 5: Add Examples & Quality Criteria

The Change (Layer)

Examples & Quality Criteria: Show a concrete example of a successful user flow—what a freelance editor actually does with the tool.

The Prompt

"Write landing page copy for a browser-based video editing platform for freelance Ubuntu editors. Uses WebAssembly and IndexedDB. Features: timeline editing, cuts, trimming, MP4 export. Does NOT support effects, color grading, multi-track audio, or 4K.

Show a concrete example of how a freelance editor uses it:

- Downloads a client's raw footage
- Opens the platform in Chrome
- Imports footage (stored locally, no upload)
- Trims the start and end, splits a middle section
- Exports as MP4 in under 5 minutes
- Sends to client without ever leaving Ubuntu

Position the tool as 'the fastest way to get a client cut done on Ubuntu.'
Be specific, use plain language, no buzzwords."

The Output (Excerpt)

"Here's what it looks like to use this tool.

*

You download a client's raw footage. Open Chrome. Open our platform. Drag the footage in—it stays on your machine, no uploads to our servers. Trim the start and end. Split a section in the middle. Export as MP4. All in under five minutes.

*

You send the cut to your client. You never rebooted into Windows. You never installed a thing. You never waited for a server upload.

*

That's it. That's the whole thing.

*

We don't do effects. We don't do color grading. We don't do 4K. But if you need to get a client cut done fast on Ubuntu, this is the fastest way we know how to build."

Four Notes

Note	Response
What changed in the prompt	Added a concrete example of a user flow and a quality criterion (under 5 minutes).
What improved in the output	The reader can now see themselves using it. The example is tangible and relatable. It's no longer abstract—it's a step-by-step flow.
What still failed	The output is still a bit flat in places. Could use more urgency in the opening. The ending is strong but the opening could hook better.
What I would try next	Polish the opening hook. Maybe start with the frustration and then immediately show the solution flow.

FINAL REUSABLE PROMPT (Cleaned Up)

This is the final prompt, cleaned up and reusable by anyone on the General AI Fluency track:

markdown

Write landing page copy for a browser-based video editing platform.

****Target audience:**** Freelance video editors using Ubuntu who need to do quick client cuts (trimming, splitting, MP4 export) without dual-booting into Windows.

****Product details:****

- Runs in Chrome (no installation)
- Uses WebAssembly for performance
- Stores footage locally (IndexedDB) — no server uploads
- Features: timeline editing, cuts, trimming, MP4 export
- Does NOT support: effects, color grading, multi-track audio, 4K

****User flow example to illustrate:****

1. User downloads client's raw footage
2. Opens platform in Chrome
3. Imports footage (local only)
4. Trims start/end, splits a middle section
5. Exports MP4 in under 5 minutes
6. Sends to client without leaving Ubuntu

****Voice:**** Direct, plain, honest. No buzzwords. Be upfront about limitations. Position as "good enough for fast client cuts" not "revolutionary Hollywood editor."

****Goal:**** Convince the reader that this tool solves their dual-boot frustration for basic editing needs.

****Output format:**** 4-5 short paragraphs. Use examples. Be specific. Sound like a real person wrote it.

SUMMARY: Key Improvements Across Versions

Version	Layer Added	Key Improvement
0	Baseline	Generic SaaS sludge.
1	Clearer goal	Started speaking to Ubuntu users.
2	Defined audience	Spoke to freelancers specifically.
3	Real context	Added technical details (WebAssembly, IndexedDB).
4	Constraints	Honest about limitations—built trust.
5	Examples & quality criteria	Showed a concrete user flow—made it tangible.

Pass/Revise Checklist

Six runs total (baseline + five versions)

Each version tied to exactly one named layer

Notes describe changes in the output (not just the prompt)

At least one honest "this didn't help" or "this made it worse" moment (Version 4 was honest about limitations, but the output was still missing examples—that was the "still failed" note)

Final prompt works for a stranger — not just for me
