AI INTERVIEW TRANSCRIPT

(Showing how I used AI to surface my real answers, not to write for me.)

Claude: What was the problem you were trying to solve?

Me: I needed to edit video on Ubuntu, but DaVinci Resolve required an NVIDIA GPU, and my PC has Intel integrated graphics. I tried other tools like Kdenlive and OpenShot, but they were either too basic or crashed constantly. I was stuck dual-booting Windows just for one task.

Claude: Why did that matter to you personally? Not just as a technical inconvenience.

Me: Because I was losing time. Every time I needed to edit a freelance video, I had to reboot into Windows, wait for everything to load, edit, render, then reboot back to Ubuntu. It added 20–30 minutes per session. After a while, I just stopped editing videos altogether because the friction wasn't worth it.

Claude: What did you decide to do about it?

Me: I decided to build my own web-based editor that runs in the browser. No installation, no GPU lock-in, just open Chrome and go. It was ambitious—maybe too ambitious—but I figured if I could make it work, it would solve my problem permanently.

Claude: What was the hardest decision you made during the build?

Me: Cutting features. I wanted to build a full DaVinci clone with effects, color grading, audio mixing, everything. But I had to be honest with myself—I'm one person, not a team. I focused on timeline editing, basic cuts, and MP4 export. Everything else got deferred. I told myself I'd add it later, but honestly, I probably won't. The core is what matters.

Claude: What came of it? What can you now prove?

Me: I shipped a working MVP. It's not beautiful—the UI is functional but basic—but it works. I can edit video on Ubuntu without rebooting. It proves that professional-grade video editing on Linux is possible without proprietary hardware. And I learned that I'm good at making hard trade-offs and still delivering something useful.

FRAMED CASE STUDY

Video Editing for Ubuntu

The Problem

I needed to edit video on Ubuntu, but DaVinci Resolve required an NVIDIA GPU—and my PC has Intel integrated graphics. Other Linux editors were either too basic (no proper timeline) or too unstable (crashed on export). Every editing session meant rebooting into Windows, which added 20–30 minutes of friction. Eventually, I stopped editing videos altogether because the hassle wasn't worth it.

What I Did (and Decided)

I built a web-based video editor that runs entirely in the browser—no installation, no GPU lock-in, just open Chrome and go. The hardest decision was cutting features. I wanted a full DaVinci clone, but I'm one person, not a team. I focused on:

- Timeline editing** (drag-and-drop clips, trim, split)
- Basic cuts** (no effects, no color grading—just clean edits)
- MP4 export** (fast, reliable, web-optimized)

I chose WebAssembly for performance and IndexedDB for local storage so users never have to upload footage to a server. The UI is functional but plain—I prioritized reliability over polish.

What Came of It

A working MVP that handles basic video editing on Ubuntu. It's not DaVinci, but it doesn't need to be. I proved that professional-grade video editing on Linux is possible without proprietary hardware. More importantly, I proved I can take an ambitious idea, make hard trade-offs, and ship something that actually solves a real problem.

Bio

I'm a full-stack engineer with 10 years of experience building web applications. I care about accessibility, performance, and making tools that actually work for the people who need them.

BEFORE/AFTER COMPARISON

Before (Generic AI Copy)

"I am a passionate and results-driven full-stack developer with a strong commitment to accessibility and user-centric design. I built a revolutionary video editing platform that leverages cutting-edge web technologies to deliver an unparalleled user experience across all devices. By focusing on performance and accessibility, I created a solution that empowers creators of all technical backgrounds to edit video seamlessly without being locked into proprietary ecosystems."

After (Edited Version - My Voice)

"I built a web-based video editor for Ubuntu because DaVinci Resolve wouldn't run on my Intel GPU. I cut features ruthlessly—no effects, no color grading, just timeline editing and export. It's not revolutionary. It just works. And that's the point."
